

# Developing Ajax Applications using Google Web Toolkit (GWT)

Enea Claudius FLUERAŞ

## **Abstract**

*GWT is a Java-based open source framework that allows developing of Ajax-based web applications. The developer writes code in Java and then GWT converts it into browser - compliant JavaScript and HTML. GWT provides all the common user-interface widgets, listeners to react to events happening in the widgets. GWT can be used in an Integrated Development Environment to write and debug an Ajax application, placing breakpoints in the code and debug from client side to server side.*
