

A Genetic Algorithm-based Approach for Passive Filter Design

Paul FARAGÓ, Gabriel OLTEAN, Sorin HINTEA

Abstract

The analog part plays an important role in mixed-signal systems. Yet, its design is more time and effort consuming than its digital equivalent. As such, automated tools are developed for analog circuit design. This paper proposes a genetic algorithm-based method for topological and parametrical level analog filter design. The proposed method will then be employed for the design of a passive normalized low-pass filter.
